1. Introduction:

1.1 Executive Summary:

LMS learning management system is a software application for the administration, documentation, tracking, reporting and delivery of educational courses or training programs or learning and development programs. The learning management system concept emerged directly from e-Learning. The system offers sign up for students and teacher. LMS offer students track their grades, attendance, assignments, course materials and offer online delivery of their assignments and communication with their instructors. LMS also offers to instructors to introduce their material, assign students to their class, put tasks and assignments, update their attendance, grades and make analysis on them, take reports and feedback about their progress.

1.2 Document Overview:

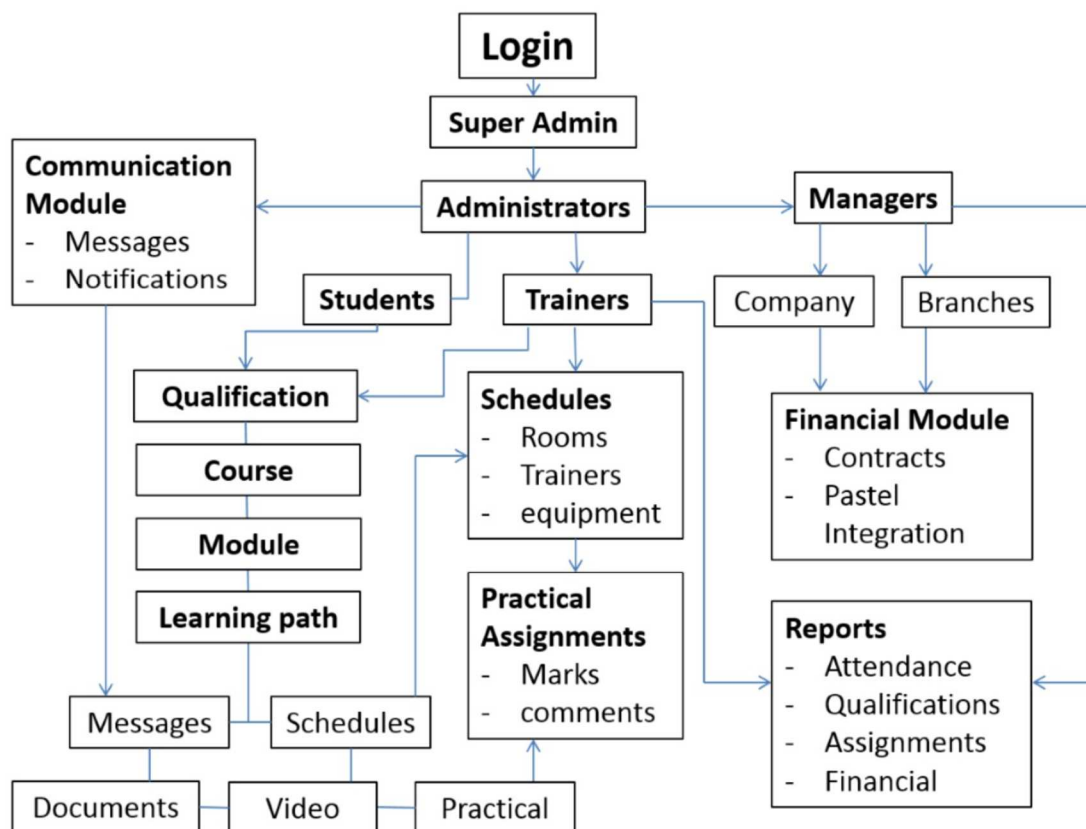

This document introduces Learning Management System product study plan. It introduces general description, constraints on the system, functional requirements of the system, domain requirements of the system, working system and user interfaces.

2. System Description:

2.1 Introduction:

LMS learning management system deals with all kind of student details, academic related reports, college details, department details, exam mark details, section details and graph details too. It tracks all the details of a student from the day one to the end of his course which can be used for all reporting purpose, tracking of attendance, mark details, percentage calculations, completed semesters years, exam details, cycle test1, cycle test2, cycle test3, model exam, university result etc. To maintain the information of students (Attendance, personal and academics) to generate the reports in various ways (pdf, excel). To made retrieval of data easier.

2.1.1 System Architecture:

2.2 System Users:

The system is divided into two parts one can accessed by Teaching staff and the other can be accessed by students.

2.3 Sytem Modules:

The system consists of following modules:

Storage

LMS uses different types of storage

- Core storage for student modules and user interaction
- Core storage for education materials and time table module
- Archive storage for historical changes, deleted contents and old logs
- System storage for system configuration, user's information and fresh logs
- Indexing storage to support full text search engines
- Analytics storage(s) to store the outcomes of data analytics module

Data Processing

Data processing module is responsible on providing all data related services like data modeling, data transformation, data classifier and multimedia processing.

Data Analytics

LMS System holds huge amount of contents which includes students information, user interaction and logs, Attendance Module, Time Table Module, Student Analytic Module and assignments module.

Indexing

This module is responsible on indexing textual contents to allow internal full text search queries.

Security

Security module is responsible on user authentication and communications security

General User Area

This module provides user with main system activities like accessing the attendance module, accessing the assignment module, pursuing his grades and the time tables.

Attendance Module

Instructors and teaching assistants can use the Attendance activity to record student attendance.

Assignment handle Module

The assignment module allows teachers to collect work from students, review it and provide feedback including grades.

Time Table Module

Timetable Generation is one of the most complicated and time-consuming tasks for every school\institution as each class has a unique time table with specified subjects and teachers.

Student Analytic Module

Student analytic module is responsible for doing some mathematical function on student's grades.

System Administration Area

This module is dedicated for system administrators.

3. System Users:

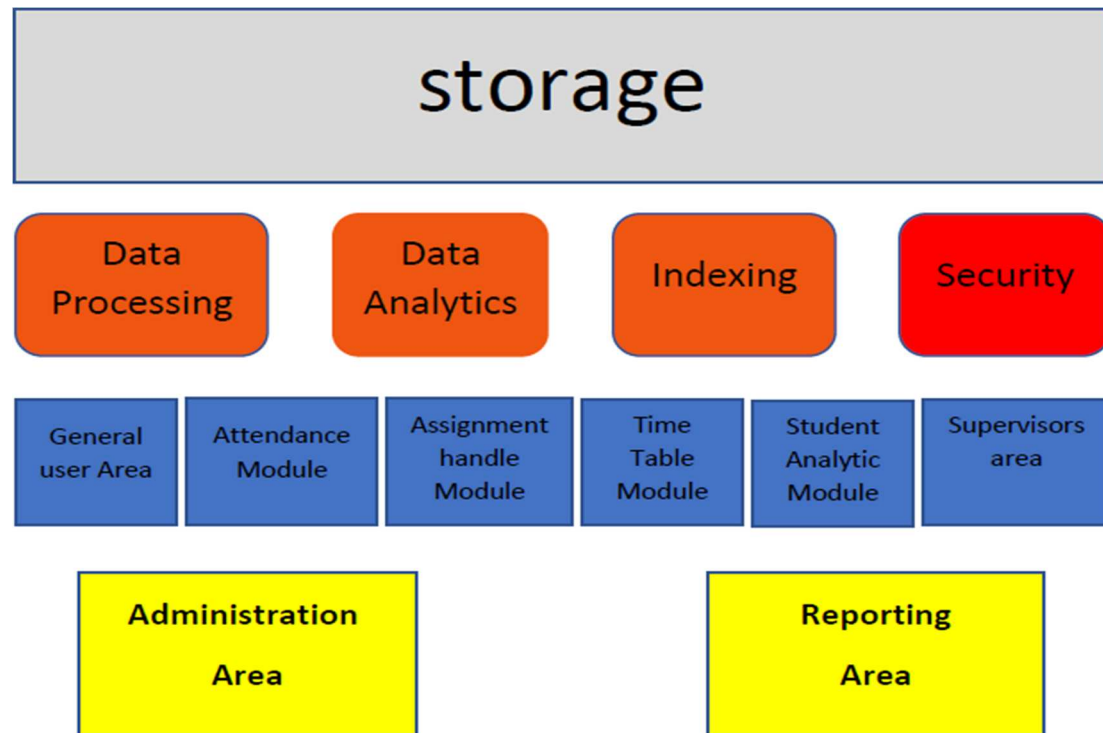

3.1 Teachers

- Teacher can access his courses and related materials
- Teacher can access the course attendance and edit it
- Teacher can access the course assignments and make one
- Teacher can put the course timetable
- Teacher can view his students' grades and analysis them

3.2 Students

- Student can access his courses and related materials
- Student can access his attendance and grades
- Student can access his assignments and submit
- Student can access his timetable

4. System Modules:

4.1 Storage

LMS uses different types of storage

- Core storage for student modules and user interaction
- Core storage for education materials and time table module
- Archive storage for historical changes, deleted contents and old logs
- System storage for system configuration, user's information and fresh logs
- Indexing storage to support full text search engines
- Analytics storage(s) to store the outcomes of data analytics module

Core storage uses NOSQL unstructured database installed over distributed infrastructure. Unstructured scheme allows flexible data definition and allow future extension of question types. NOSQL database speed up the queries compared with raw data storage format. Cloud infrastructure offer high availability and instant recovery of data. Archive storage uses JSON data format stored directly over distributed storage. JSON allow flexible access of data attributes. Distributed storage allows fast access of data items and offer expandable storage. Data replication is configured to minimum which full data availability and data recovery needs of archiving information.

System storage uses traditional structured database which provide better queries and data processing over structured contents.

4.2 Data Processing

Data processing module is responsible on providing all data related services like data modeling, data transformation, data classifier and multimedia processing. Data modeling is required to understand the textual material based on the related language model, this will allow better revision and improve the quality of education information. Data transformation is required to allow import and export of different data format. The system supports common data formats supported by common data processors applications. Multimedia processing is required to enhance the quality of multimedia contents like images, audio and video. It converts multimedia contents to unified format. Also, this service is required to detect some features required by data classifier service. Data classifier is required to classify the contents which is important to avoid non-appropriate material. The classifier uses information retrieved by data modeling and image and video processing services.

4.3 Data Analytics

LMS System holds huge amount of contents which includes students information, user interaction and logs, Attendance Module, Time Table Module, Student Analytic Module and assignments module. This module is important to study the contents and produce very useful result. Basically, this module support following data analytics.

Similarity analysis to determine similar examination contents. This analysis is important to avoid generating exams having similar questions.

Quality analysis to study the correctness of examination contents based on user interaction. High quality contents will be published to all users. Low quality questions are used only by their authors and related users. Security analysis to study user behavior to avoid future attacks. Basically, this analysis users logs to study user behavior.

Statistical analysis to produce a set of statistical studies regarding contents and user's interaction. For example, this analysis can study the distribution of student information contents vs. time or region or language

4.4 Indexing

This module is responsible on indexing textual contents to allow internal full text search queries. Full text search is used by final users to find certain contents. Also, it is used by other modules like data processing to locate contents in a fixed time regardless the overall contents size.

4.5 Security

Security module is responsible on user authentication and communications security. User can register/login using internal accounts or via their phones or common social accounts. The portal access is made using https protocol in order to secure the communication.

Security module also responsible on managing the permissions and roles. Users are either guests, logged users, school books authority owners, supervisors.

Security module also, responsible on detecting the threats and preventing data theft. The system is tested against common attacks using known penetration testing tools. Data theft is prevented using various data protection techniques as described in "IMS Process Security" feature.

4.6 General Use Area

This module provides user with main system activities like accessing the attendance module, accessing the assignment module, pursuing his grades and the time tables.

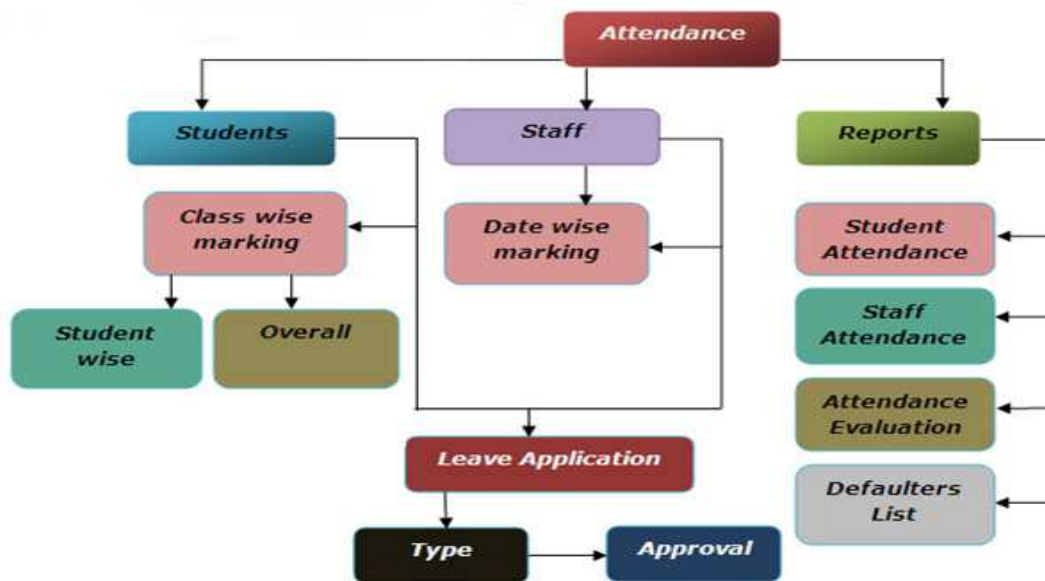

In online exams, users can view results after examiner approval. Users can view examination history and achieved results.

In additions, users can browse and find courses topics also, users can edit their profiles and view other user's profiles.

General system support material are published to help users. However, users can communication with system operators to report issues or to get a direct support.

4.7 Attendance Module

Instructors and teaching assistants can use the Attendance activity to record student attendance. Each mark (e.g., Present, Late, Excused, Absent) is assigned a point value, and the aggregate score for each student appears in a single column in the LMS grade book. Students can also view their own attendance record and any instructor comments in the Attendance activity itself.

4.8 Assignment handle module

The assignment module allows teachers to collect work from students, review it and provide feedback including grades. The work students submit is visible only to the teacher and not to the other students unless a group assignment is selected.

Students can submit any digital content (files), including, for example, word-processed documents, spreadsheets, images, audio and video clips. Assignments don't necessarily have to consist of file uploads. Alternatively, teachers can ask students to type directly into a text field in the website. Or they can ask student to do both, upload a file or files and type text directly into the website. An assignment activity can also be set up to not accept any student submissions and serve as a reminder to students of a 'real-world' assignment they need to complete and to record grades in moodle for activities that don't have an online component.

An assignment has an 'available from' date before which no students can submit anything, and a due date, after which teachers can choose not to accept submissions any more.

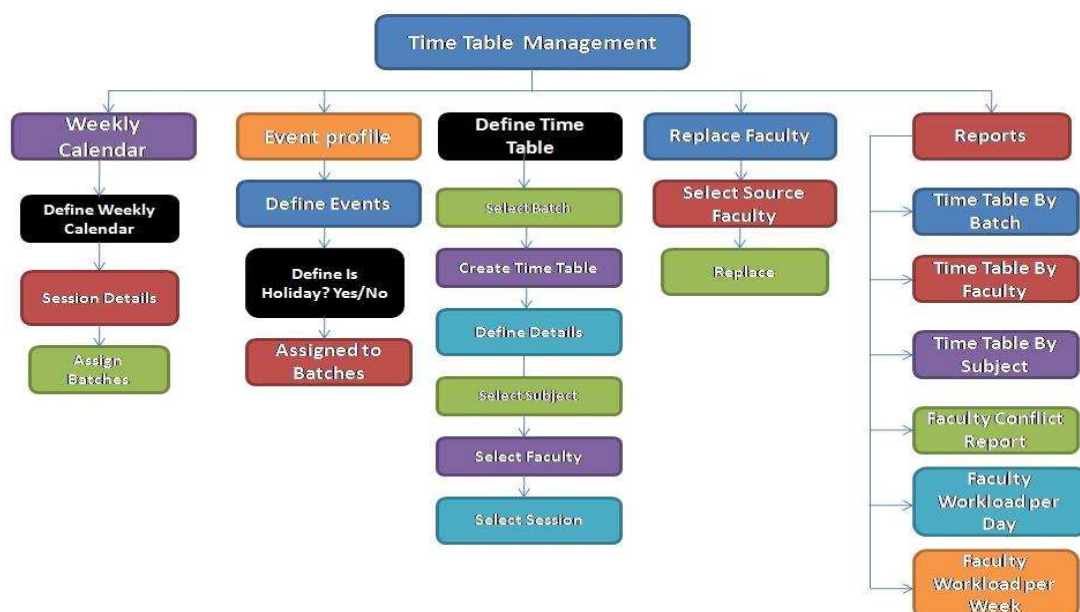

Markers can choose to be notified every time a student submits an assignment, or only for late submissions. Markers can choose to give students feedback in the form of text or uploaded files.

This module let the students to know the assignment required to deliver and the deadline of those assignments, students can upload those assignment and know their grades after supervisors check them.

4.9 Timetable Module

Timetable Generation is one of the most complicated and time-consuming tasks for every school/ institution as each class has a unique time table with specified subjects and teachers. This Timetable Software generate teachers time schedule easily and quickly. This software provides best solution in creation of timetable in a very simple way and avoids time conflicts in adjustments.

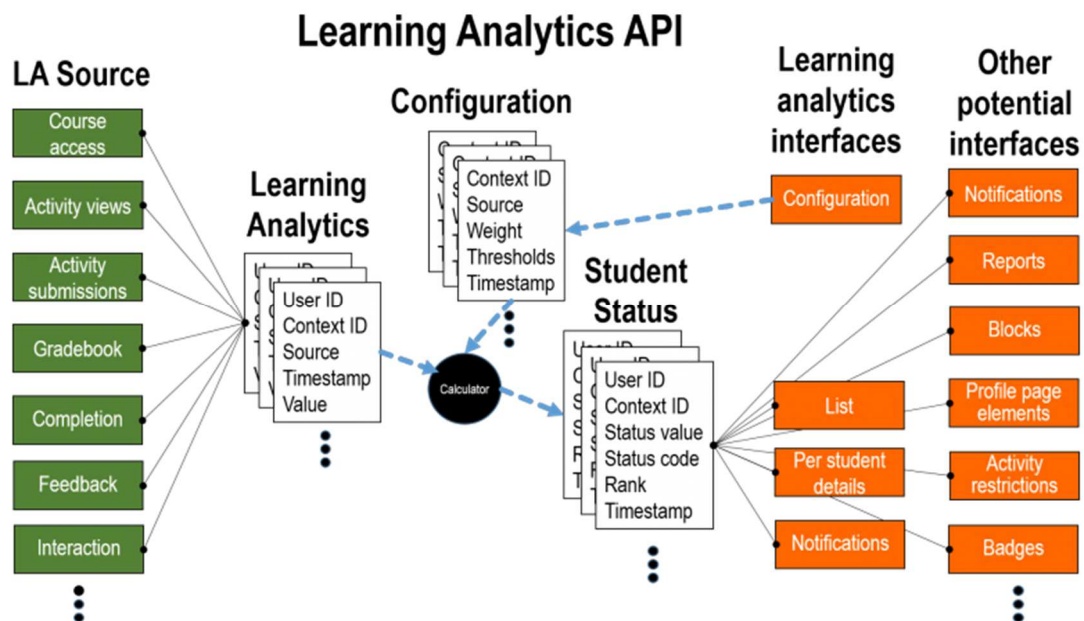

- Option for one-week or two-week timetables
- Manual (standard) or automatic (optional) timetable creation using pre-defined parameters
- Full integration with the Staff and Attendance Modules as well as the online Portals
- Setting of individual timetable parameters for each year group
- Creation of multiple timetables for each year group
- Individual student timetable printouts
- Period locking - ideal for registration times or fixed tutorial sessions
- Easy location of staff and students by using the staff and student finder function
- Flexible staff planning by allocating preferred periods and identifying part-time staff
- Ability to manage Staff Cover and identify available teachers
- Timetable print options in formats suitable for form rooms, staff rooms or school notice boards

4.10 Student Analytic module

Student analytic module is responsible for doing some mathematical function on student's grades.

For each student it is **responsible** for calculating the GPA, and all student it is responsible to classifying the students based on the aspherical order in the student's name-sheet, calculating the maximum, the average grades, and classifying all the students ranks based on their degrees.

4.11 Supervisors area

This module is dedicated for system operators. System operators are responsible on managing the system operation and contents. System operators, can access all system contents, view statistical reports, and provide direct support to users.

4.12 System Administration Area

This module is dedicated for system administrators. System administrators responsible on system management, configuration, backup and solving technical issues. System administrator can view system status, data status, online sessions, logs and other system status and measures.

4.13 Student Fees

Student fees module, It is also called student Fees management System. Admin can manage fee details of students, like how much fee is pending of a student or is there any changes in fee, policy admin can control all these things.

5. System Functions:

[FR_AC_1] Account settings

[FR_RE_1.1] Registration function

Description : Sign up for a new account

Actor : Student: student can create a new account to enjoy the system features

System: save the Info on the data base

Teacher: teacher can create a new account to enjoy the system features

Inputs : full name, username, password, email, phone and country

Outputs : Nothing

Pre-conditions : Click Sign up

Post-conditions : The user will be directed to the main home page

[FR_LO_1.2] Login function

Description

User enter username & password in prompt then presses login button then he/she can access his/her information according to their authority.

Actor : Student: student can log in to enter the student's home page

System: check the validation of the data entered.

Teacher: teacher can log in to enter the teacher's home page

Inputs : username & password

Outputs : Nothing

Pre-conditions : valid email , length of password

Post-conditions : The user will be directed to the main home page

[FR_LO_1.3] Logout function

Description : if user want to log out of the website then he can click on it to end his session.

Actor : Student: student can log out from his account

System: ends the User session on the website

Teacher: teacher can log out from his account

Inputs : User click on logout button

Outputs : Nothing

Pre-conditions : the user is logged in

Post-conditions : the user directed to website main page

[FR_PV_1.4] Profile view function

Description

student can view their profile from this function. Here admin can provide some authority to update the profile like he/she can change their mobile number, email address.

Actor : Student: student can enter the profile page to see the profile info

System: the system redirect the user to his/her profile page

Teacher: teacher can enter the profile page to see the profile info

Inputs : User clicks on profile icon

Outputs : His/Her profile info

Pre-conditions : user must be logged in

Post-conditions : the user directed to the profile page

[FR_CO_2] Course Management:

[FR_AV_2.1] Attendance view function

Description

student can view their attendance status from this function. You can see here attendance alert system here like if attendance is very less then it will show in red color, if attendance is fine then it will show in blue color.

Actor : Student

Inputs : Course ID

Outputs : his/her attendance

Pre-conditions : Correct Course ID

Post-conditions : user directed to attendance table page

[FR_GV_2.2] Grades view function

Description

From this function a student can see internal marks and results. Here you can put a function of a printed result, so if any student want to print result he/she can do that.

Actor : Student

Inputs : Student ID

Outputs : His/Her Grade

Pre-conditions : Correct Student ID

Post-conditions : User directed to grade sheet

[FR_FD_2.3] Fee details view function

Description

A student can check their fee status from this function. he/she can check their pending fee from this function, you can add print fee slip and fee alert feature in this function.

Actor : Student

Inputs : Course ID

Outputs : Course Fee

Pre-conditions : Correct Course ID

Post-conditions : User will be directed to the Course's fee page

[FR_NO_2.4] Notification function

Description

In this function students can check the notification and news which is delivered by the administrator.

Inputs: User Clicks on the notification icon

Outputs: Notification feed

Pre-conditions: User logged in Successfully

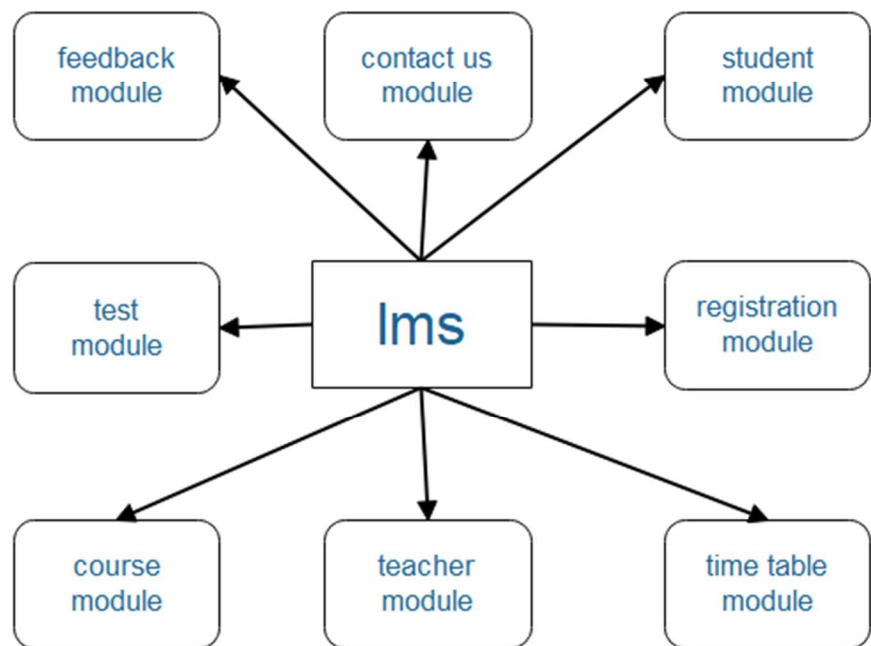

Post-conditions: User will be directed to the notification page

6. System Models:

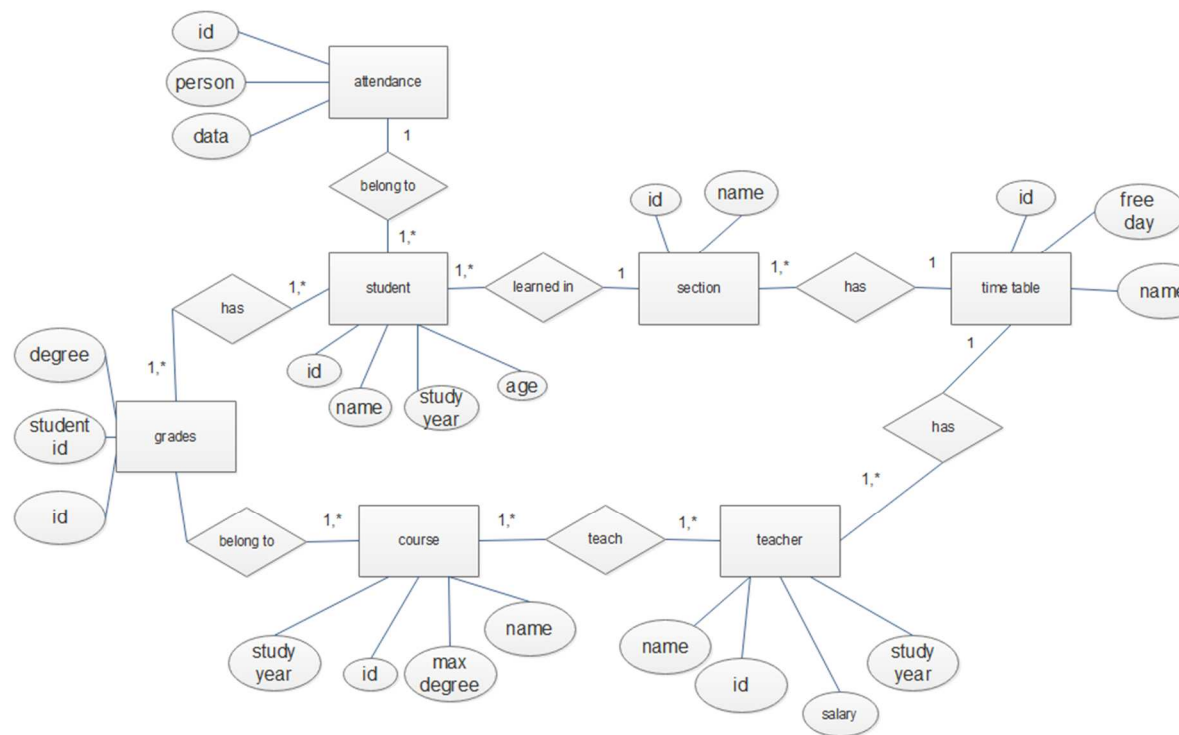

6.1 Context Diagram:

context diagram

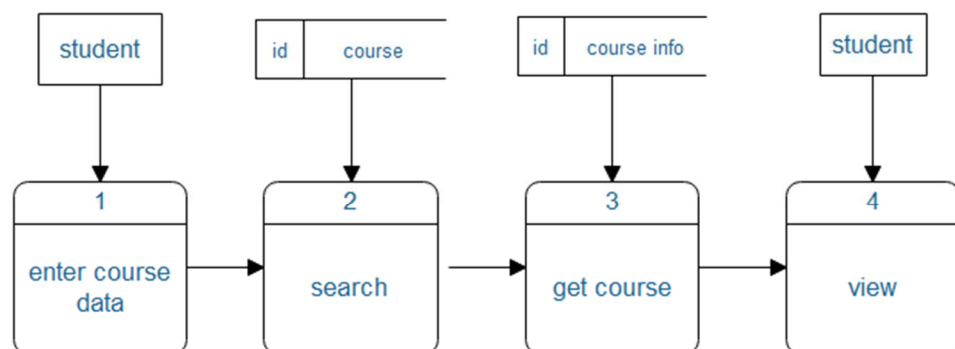

Rectangular Snip

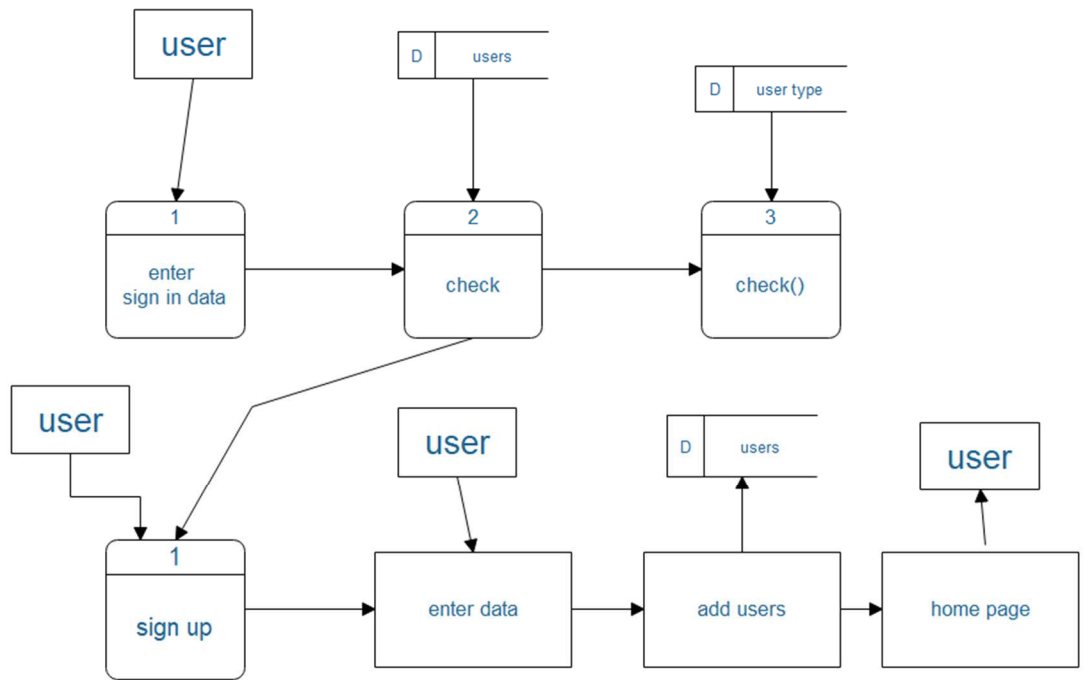

6.2 ERP Diagram:

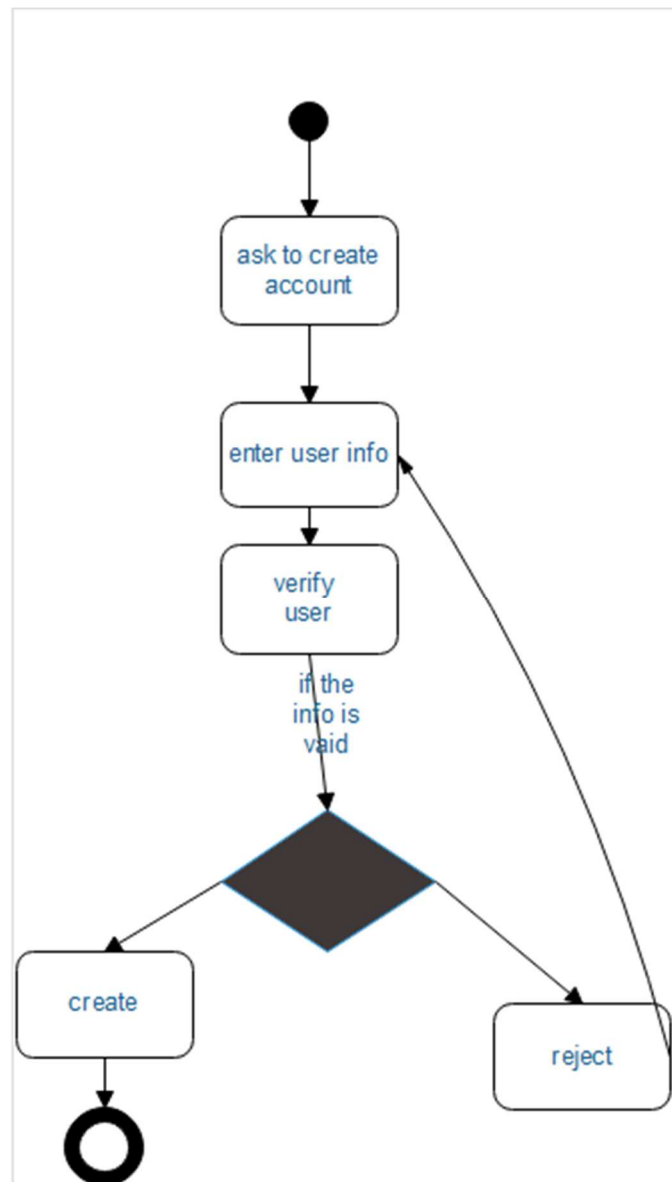

6.3 Data flow Diagrams:

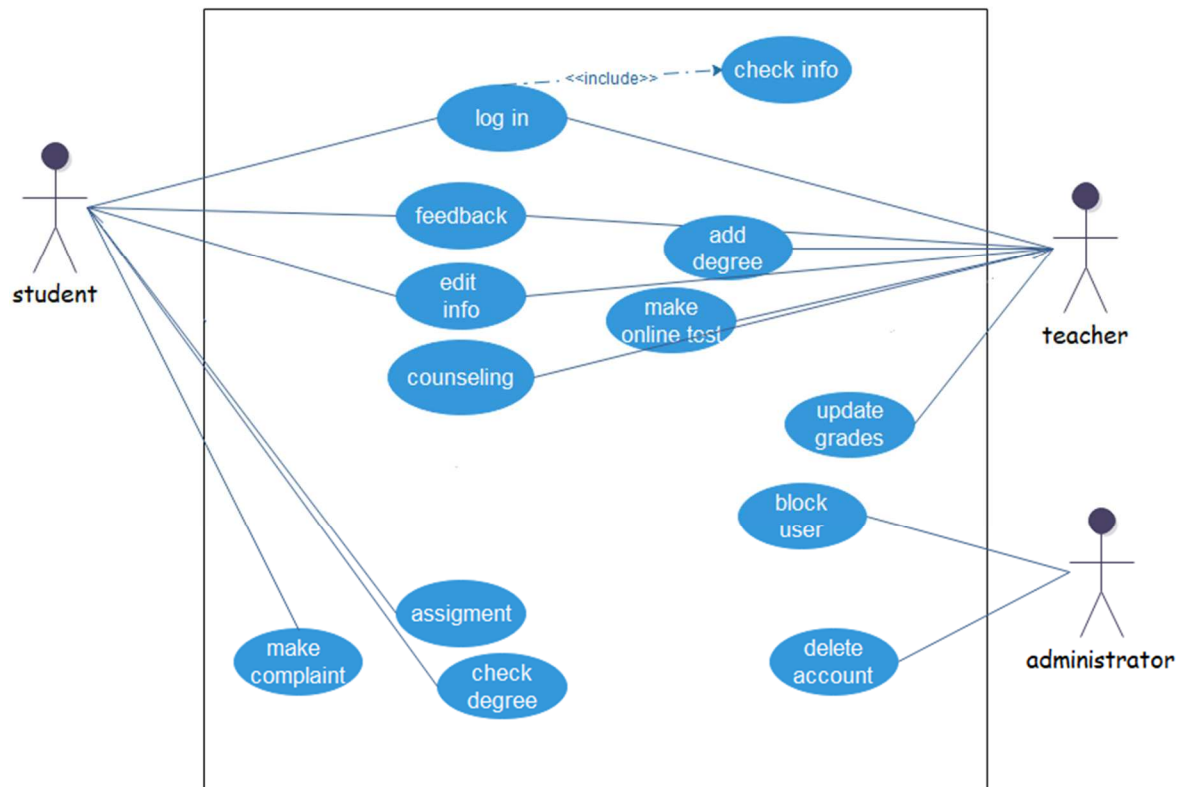

6.4 Activity Diagram:

6.5 Use Case Diagram:

6.6 Sequence Diagram:

7. Non-functional Requirements:

[NFR_SE_1] Security Requirements

- Students' data is invisible to other students
- Teachers are allowed to view students data in courses they teach
- Student shall be forced to change their password the next time they log in if they have not changed it within the length of time established as password expiration duration.
- The system must provide configurable role-based authentication.
- The system shall protect the user's privacy
- Network security
- Backups

[NFR_US_2] Usability Requirements

- The system must support Mobility (e.g., phones and tablets).
- The system must support all current versions and any previous supported versions of modern web browsers including Internet Explorer, Firefox, Chrome and Safari.
- The system shall have a single login to access all content
- The system shall have a consistent UI (in all the views and dialogs, the UI elements behave and are placed in a similar way)

[NFR_PE_3] Performance Requirements

- The system must be interactive
- Delays involved must be less
- The system shall consume very little of primary memory
- The load time for user interface screens shall take no longer than two seconds
- Queries shall return results within five seconds

[NFR_TE_4] Technology Requirements

LMS will be developed using open source tools, languages and servers. Commercial tools will be used in case there is no open source alternative

Operation	Recommended tools
Source Control and Versioning	GitHub/Git
Tasks and Issues Tracking	GitHub
Structured Database	MySQL
Unstructured Database	Text file, JSON
Programming Languages	JAVA, HTML, CSS, jQuery, PHP
Operating Systems	Windows
Documents	Google Docs
Host Management	Infinityfree website
Planning	MS Project, JIRA, Project Libre
UX Design	Adobe UX Tools (Commercial, Single License), photoshop

[NFR_DE_5] Delivery Requirements

- Project must be delivered on the agreed date
- Project must be delivered with all agreed requirements

[NFR_OP_6] Operation Requirements

- Programmers and application developers will have access to source code to address bugs or system enhancements
- System security and access levels are provided in the online system
- Each student's access is limited to his/her own registration records
- Only authorized system administrator has access to all student registration records

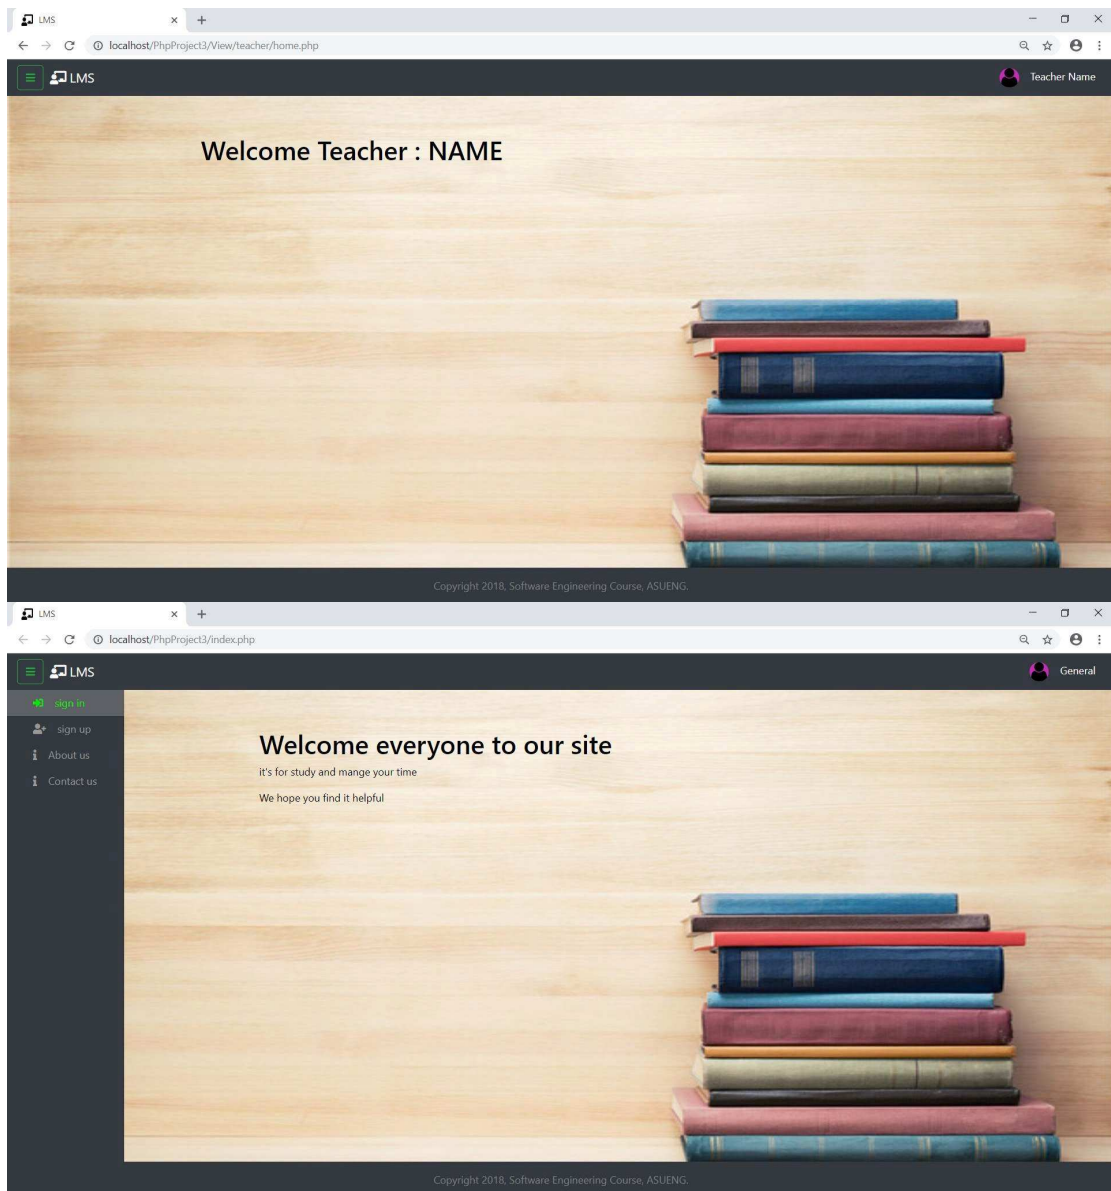

8. Domain Requirements:

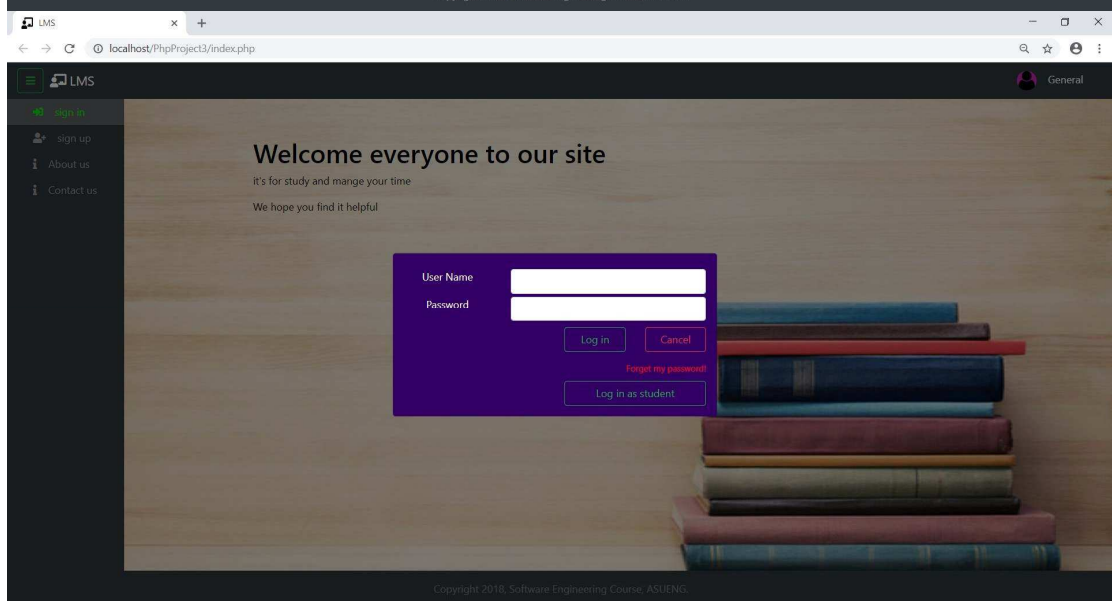

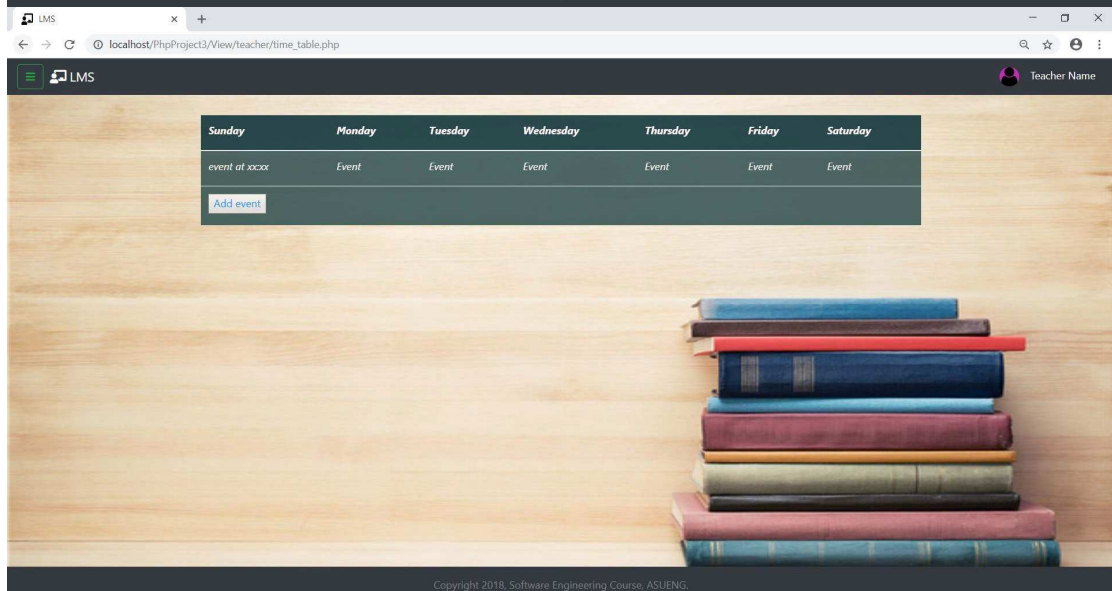

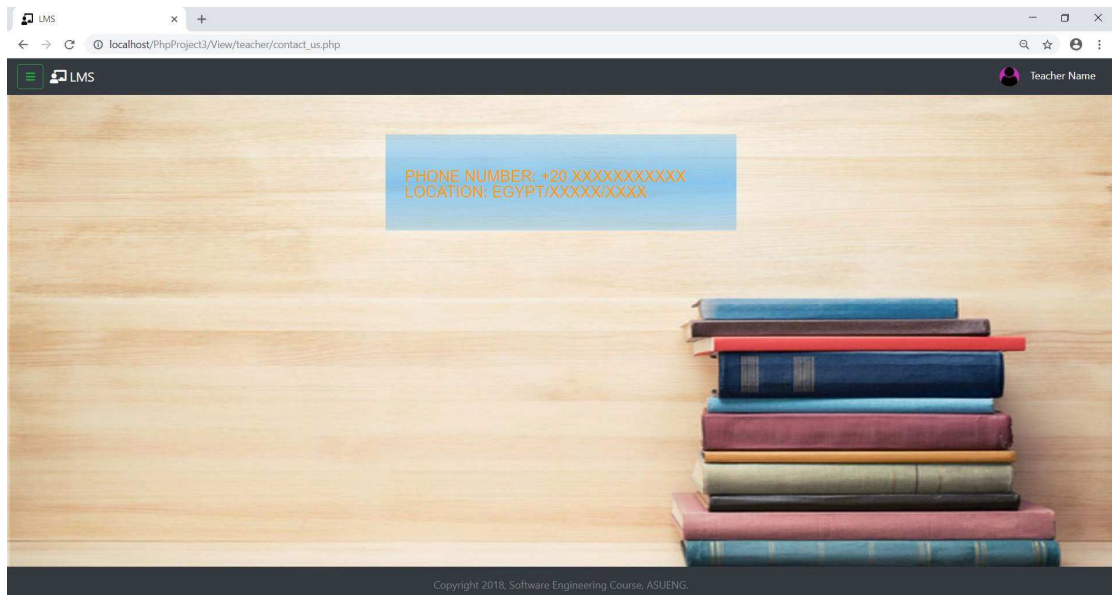

LMS Requirements

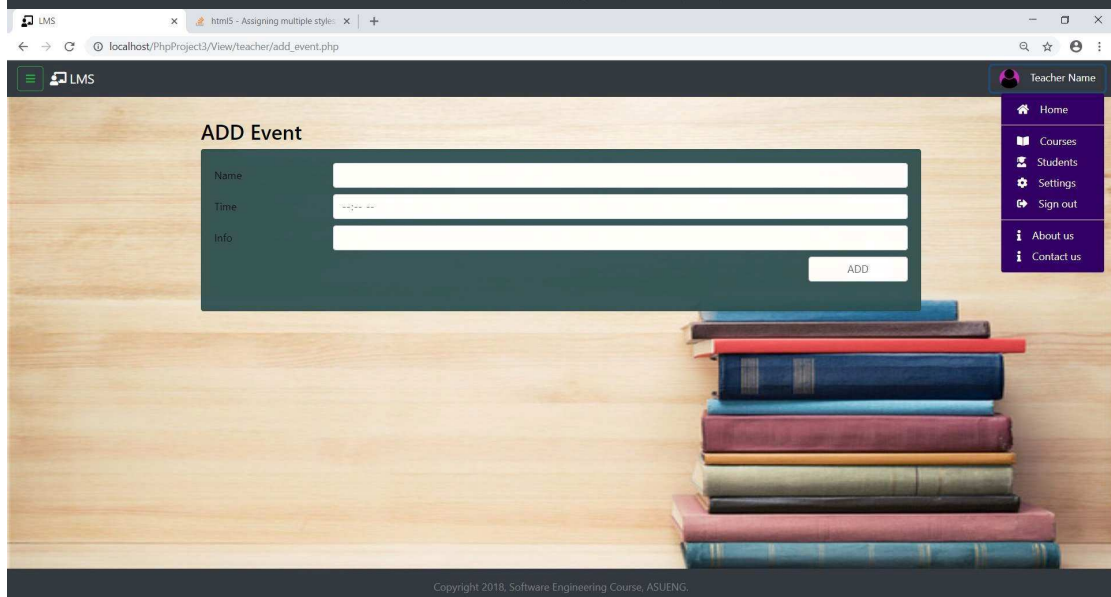

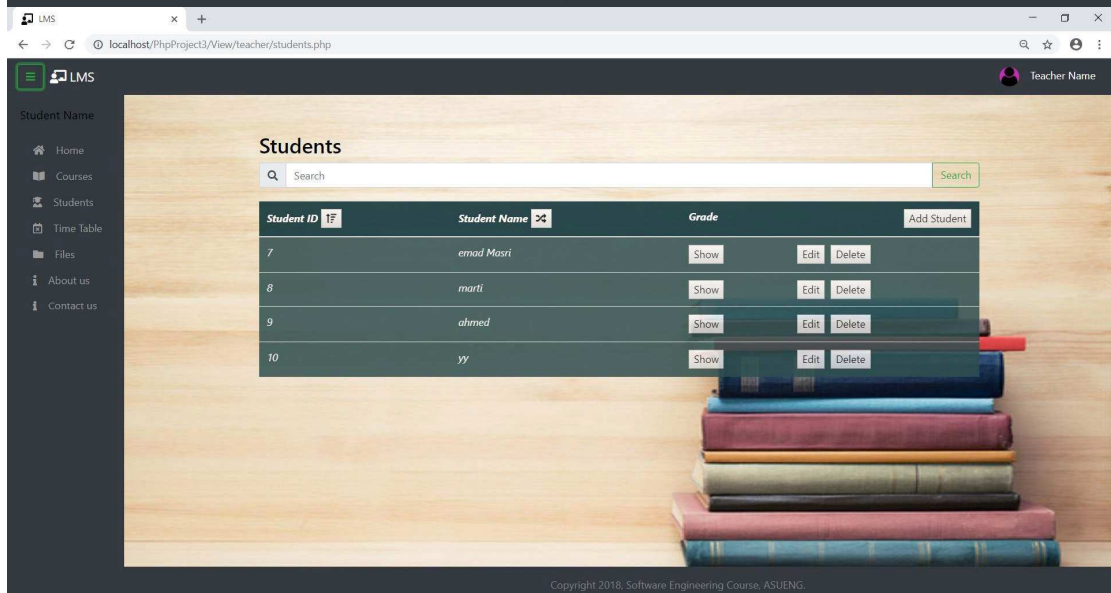

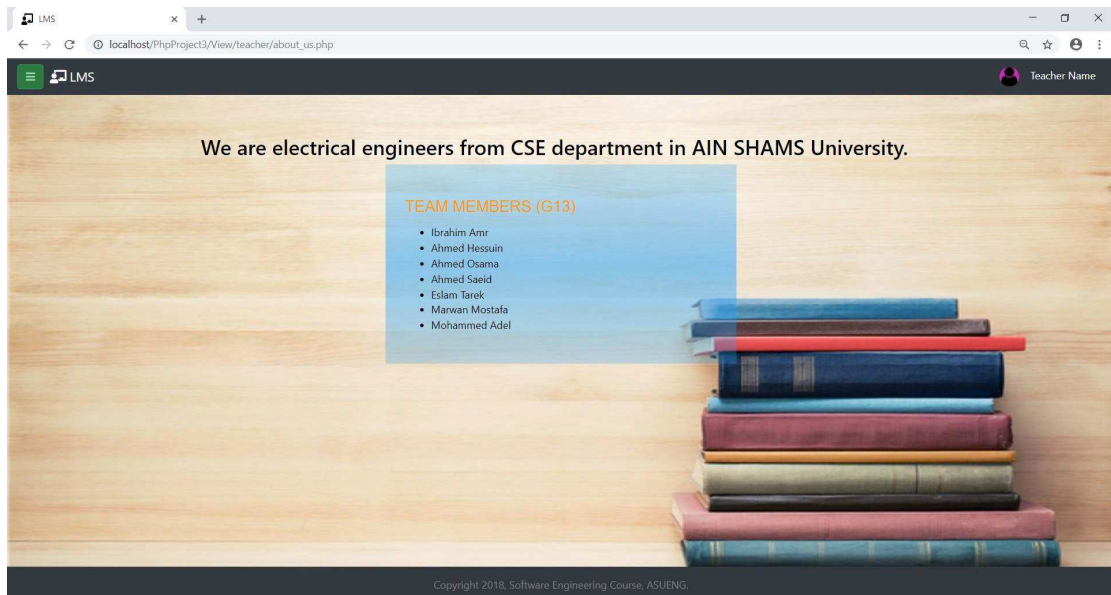

- After certain number of absence, students are warned and notified
- Doctors/Teachers should have a bachelor degree in the field they are teaching.

9. System Interfaces

User Interface:
